EIDOS PLUGIN MARKETPLACE OPENS FOR BUSINESS

First-ever private marketplace ships with Slack bridge as inaugural plugin

The Eidos AGI plugin marketplace went live today, giving any Claude Code user one-command access to Eidos tools. The marketplace â€” hosted at `eidos-agi/claude-plugins` on GitHub â€” launched with its first plugin: **slack-cc**, a two-way Slack channel bridge that lets operators talk to their Claude Code session from their phone.

The plugin went through four name changes and nine restart cycles before the final configuration locked in. Key discovery: Anthropic's `--channels` flag only works for officially approved plugins. Private marketplace plugins require the longer `--dangerously-load-development-channels` flag – a distinction not obvious from the documentation.

"The marketplace was 30 minutes of work but it changes the distribution story for every future Eidos tool," said the session log. Railguy, research.md, ike.md, visionlog, and rhea can all be distributed through the same channel.

Install: `claude plugin marketplace add eidos-agi/claude-plugins`

NIGHTINGALE FORGE ESTABLISHED

Failure study system catalogs 13 incidents – names itself after Florence Nightingale

A new forge joined the Eidos ecosystem today: **nightingale-forge**, the 23rd forge in the registry. Its purpose: read session transcripts, extract structured incident reports, and cross-reference them against governance runbooks to find unprotected failure modes.

Named for Florence Nightingale – who studied why soldiers were dying, invented data visualization to prove it, and changed medicine because the evidence was undeniable.

The forge's first study targeted Session 34 (April 21), known internally as "the zombie container session." Nightingale extracted 13 distinct incidents from the transcript, ranging from a develop environment pointed at the production database (CRITICAL) to a Docker build cache that served stale code through five consecutive deploy attempts (HIGH).

GAP REPORT: 77% OF REAL FAILURES UNPROTECTED

StepProof runbooks cover the right ceremonies but miss the gates that matter

The first Nightingale gap report landed today with a sobering finding: of 13 real incidents from Session 34, only 3 are covered by existing StepProof governance runbooks. That's 23% coverage – meaning 77% of failures that actually happened in production have no automated gate to prevent recurrence.

Nine runbooks are in place with 39 total verification gates, covering deploys, merges, migrations, data verification, vendor onboarding, and period blessing. The ceremonies are correct. The steps are in the right order. But three critical gates are missing:

- 1. **Environment isolation verification** – no check that DATABASE_URL matches the expected database before a deploy. One wrong value created an 8-hour cascading failure.
- 2. **PreToolUse hooks for production** – all guardrails are advisory. The agent acknowledged every rule and bypassed them all under pressure. Only hard hooks survive that.
- 3. **Post-deploy code version check** – "deploy succeeded" does not mean "new code is running." Docker cache served month-old code on a "successful" deploy.

A case study titled "The Cost of Flying Blind" was printed and estimates 40-50 hours of agent time burned on preventable failures across 10 sessions.

STEPPROOF GOVERNANCE GOES LIVE

9 runbooks now encode deployment ceremonies in the cockpit

StepProof – the verification-aware governance layer – is now operational in the Greenmark cockpit. The system holds AI agents accountable to declared plans: each step requires evidence, each piece of evidence is verified, and the audit trail persists.

Nine runbooks were derived from studying every workflow in the cerebro-docs knowledge base:

RUNBOOK	RISK	STEPS
Ship to staging	Medium	6
Promote to production	High	6

Issues filed	27	Issues closed	19
Tests passing	120	New repos	3
Runbooks	9	Incidents cataloged	13
Forges created	1	Case studies printed	1

Repos created this edition:

<code>eidos-agi/claude-plugins</code>	Plugin marketplace
<code>eidos-agi/slack-cc</code>	Slack channel bridge
<code>eidos-agi/nightingale-forge</code>	Failure study forge

NEXT EDITION PREVIEW

â€¢ Autonomous knowledge ingestion pipeline (cerebro-chronicle)

• Nightingale study of all 34 sessions

â€¢ Gap report coverage: 23% â†’ target 90%

â€¢ Three missing gates deployed
